### **Software Prototyping**

# Rapid software development to validate requirements

©Ian Sommerville 2000

#### Objectives

- To describe the use of prototypes in different types of development project
- To discuss evolutionary and throw-away prototyping
- To introduce three rapid prototyping techniques high-level language development, database programming and component reuse
- To explain the need for user interface prototyping

### Topics covered

- Prototyping in the software process
- Prototyping techniques
- User interface prototyping

# System prototyping

- Prototyping is the rapid development of a system
- In the past, the developed system was normally thought of as inferior in some way to the required system so further development was required
- Now, the boundary between prototyping and normal system development is blurred and many systems are developed using an evolutionary approach

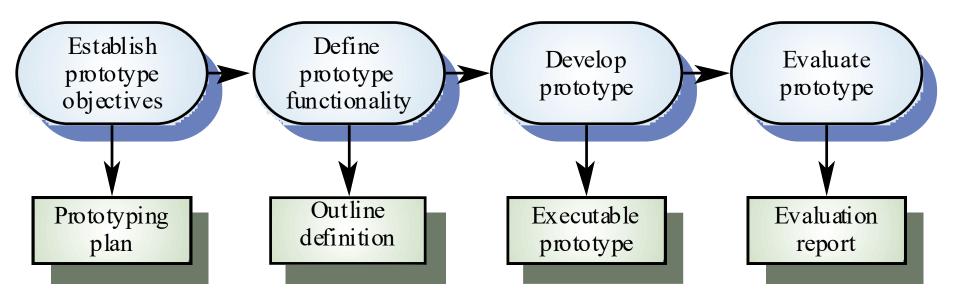

### Uses of system prototypes

- The principal use is to help customers and developers understand the requirements for the system
  - Requirements elicitation. Users can experiment with a prototype to see how the system supports their work
  - Requirements validation. The prototype can reveal errors and omissions in the requirements
- Prototyping can be considered as a risk reduction activity which reduces requirements risks

### Prototyping benefits

- Misunderstandings between software users and developers are exposed
- Missing services may be detected and confusing services may be identified
- A working system is available early in the process
- The prototype may serve as a basis for deriving a system specification
- The system can support user training and system testing

#### Prototyping process

### Prototyping benefits

- Improved system usability
- Closer match to the system needed
- Improved design quality
- Improved maintainability
- Reduced overall development effort

### Prototyping in the software process

#### Evolutionary prototyping

• An approach to system development where an initial prototype is produced and refined through a number of stages to the final system

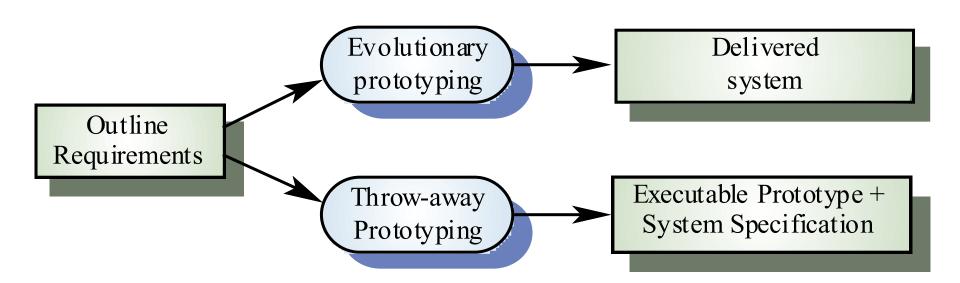

#### Throw-away prototyping

• A prototype which is usually a practical implementation of the system is produced to help discover requirements problems and then discarded. The system is then developed using some other development process

### Prototyping objectives

- The objective of *evolutionary prototyping* is to deliver a working system to end-users. The development starts with those requirements which are best understood.
- The objective of *throw-away prototyping* is to validate or derive the system requirements. The prototyping process starts with those requirements which are poorly understood

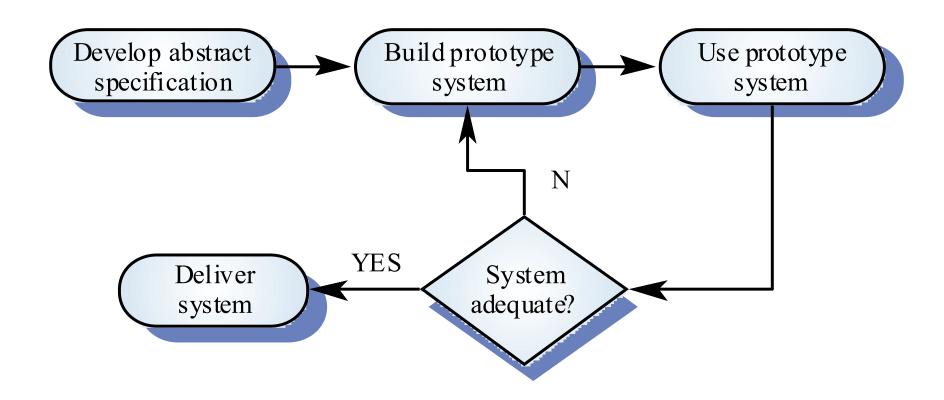

### Approaches to prototyping

# Evolutionary prototyping

- Must be used for systems where the specification cannot be developed in advance e.g. AI systems and user interface systems
- Based on techniques which allow rapid system iterations
- Verification is impossible as there is no specification. Validation means demonstrating the adequacy of the system

### Evolutionary prototyping

#### Evolutionary prototyping advantages

- Accelerated delivery of the system
  - Rapid delivery and deployment are sometimes more important than functionality or long-term software maintainability
- User engagement with the system
  - Not only is the system more likely to meet user requirements, they are more likely to commit to the use of the system

### Evolutionary prototyping

- Specification, design and implementation are inter-twined
- The system is developed as a series of increments that are delivered to the customer
- Techniques for rapid system development are used such as CASE tools and 4GLs
- User interfaces are usually developed using a GUI development toolkit

#### Evolutionary prototyping problems

#### Management problems

- Existing management processes assume a waterfall model of development
- Specialist skills are required which may not be available in all development teams

#### Maintenance problems

- Continual change tends to corrupt system structure so long-term maintenance is expensive
- Contractual problems

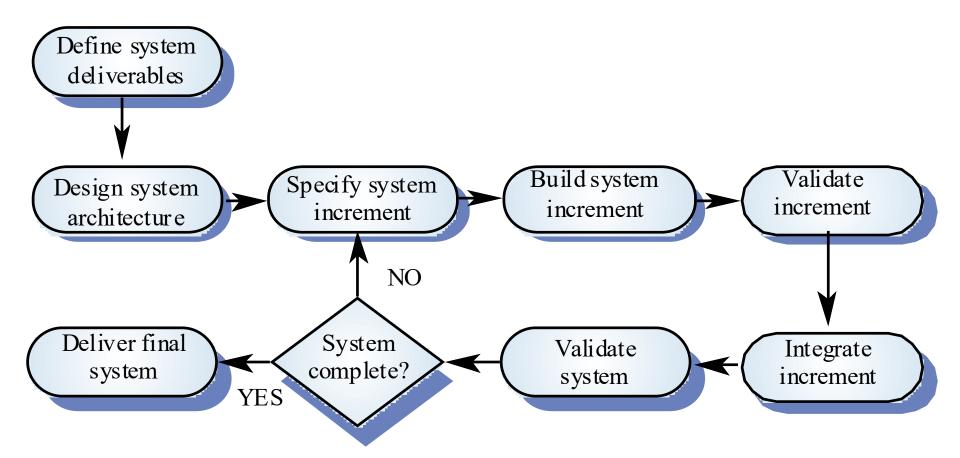

#### Prototypes as specifications

- Some parts of the requirements (e.g. safety-critical functions) may be impossible to prototype and so don't appear in the specification
- An implementation has no legal standing as a contract
- Non-functional requirements cannot be adequately tested in a system prototype

#### Incremental development

- System is developed and delivered in increments after establishing an overall architecture
- Requirements and specifications for each increment may be developed
- Users may experiment with delivered increments while others are being developed. therefore, these serve as a form of prototype system
- Intended to combine some of the advantages of prototyping but with a more manageable process and better system structure

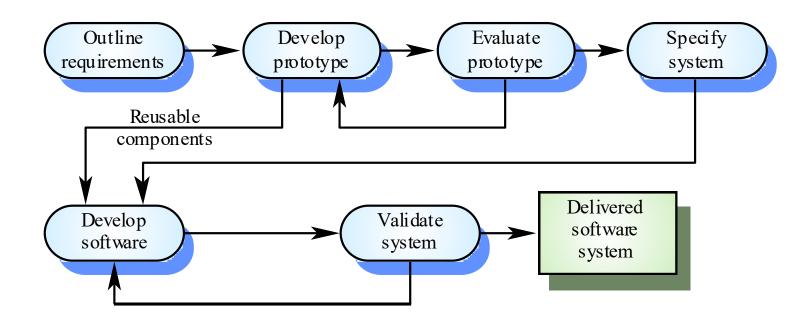

#### Incremental development process

#### Throw-away prototyping

- Used to reduce requirements risk
- The prototype is developed from an initial specification, delivered for experiment then discarded
- The throw-away prototype should NOT be considered as a final system
  - Some system characteristics may have been left out
  - There is no specification for long-term maintenance
  - The system will be poorly structured and difficult to maintain

### Throw-away prototyping

#### Prototype delivery

- Developers may be pressurised to deliver a throwaway prototype as a final system
- This is not recommended
  - It may be impossible to tune the prototype to meet nonfunctional requirements
  - The prototype is inevitably undocumented
  - The system structure will be degraded through changes made during development
  - Normal organisational quality standards may not have been applied

### Rapid prototyping techniques

- Various techniques may be used for rapid development
  - Dynamic high-level language development
  - Database programming
  - Component and application assembly
- These are not exclusive techniques they are often used together
- Visual programming is an inherent part of most prototype development systems

#### Dynamic high-level languages

- Languages which include powerful data management facilities
- Need a large run-time support system. Not normally used for large system development
- Some languages offer excellent UI development facilities
- Some languages have an integrated support environment whose facilities may be used in the prototype

# Prototyping languages

Language	Type	Application domain
Smalltalk	Object-oriented	Interactive systems
Java	Object-oriented	Interactive systems
Prolog	Logic	Symbolic processing
Lisp	List-based	Symbolic processing

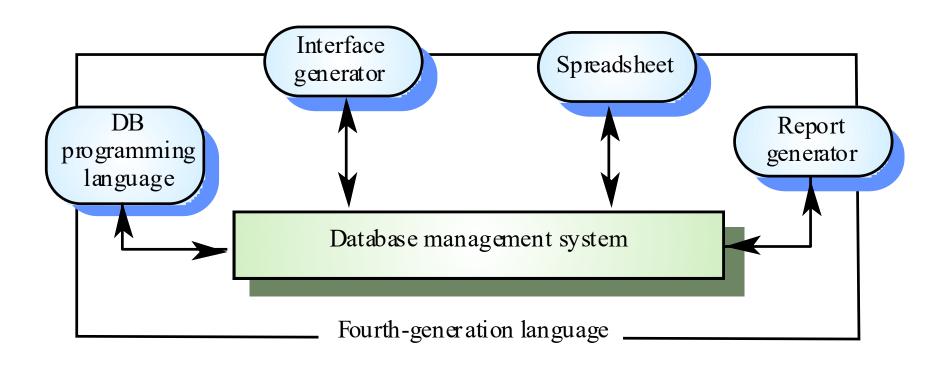

### Choice of prototyping language

- What is the application domain of the problem?
- What user interaction is required?
- What support environment comes with the language?
- Different parts of the system may be programmed in different languages. However, there may be problems with language communications

#### Database programming languages

- Domain specific languages for business systems based around a database management system
- Normally include a database query language, a screen generator, a report generator and a spreadsheet.
- May be integrated with a CASE toolset
- The language + environment is sometimes known as a fourth-generation language (4GL)
- Cost-effective for small to medium sized business systems

### Database programming

#### Component and application assembly

- Prototypes can be created quickly from a set of reusable components plus some mechanism to 'glue' these component together
- The composition mechanism must include control facilities and a mechanism for component communication
- The system specification must take into account the availability and functionality of existing components

#### Prototyping with reuse

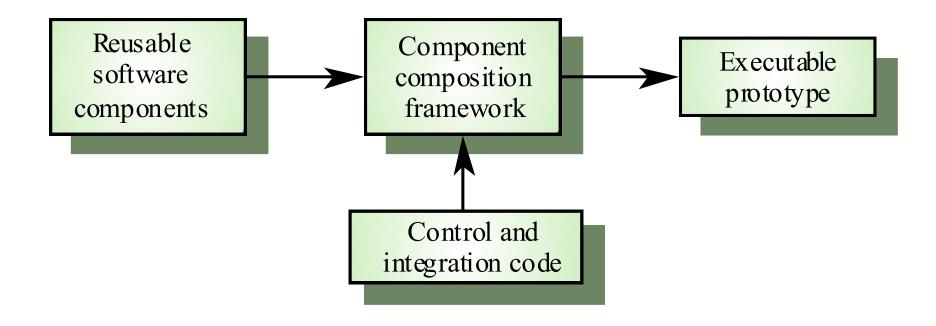

#### Application level development

- Entire application systems are integrated with the prototype so that their functionality can be shared
- For example, if text preparation is required, a standard word processor can be used

#### Component level development

- Individual components are integrated within a standard framework to implement the system
- Frame work can be a scripting language or an integration framework such as CORBA

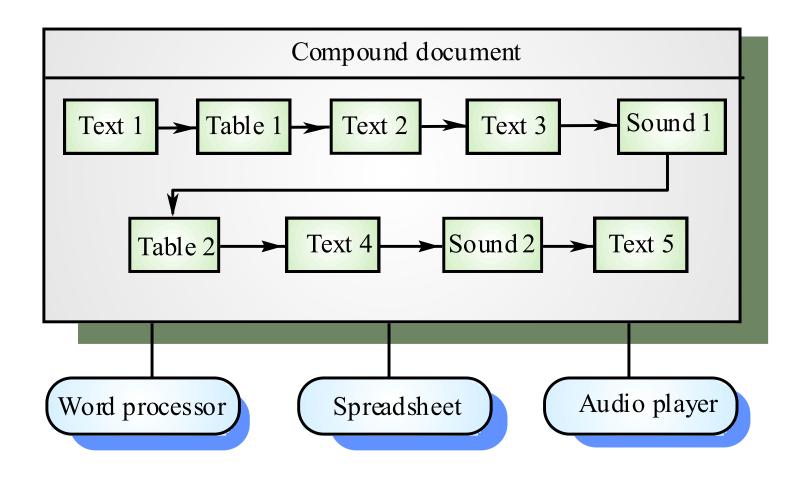

#### Reusable component composition

#### Compound documents

- For some applications, a prototype can be created by developing a compound document
- This is a document with active elements (such as a spreadsheet) that allow user computations
- Each active element has an associated application which is invoked when that element is selected
- The document itself is the integrator for the different applications

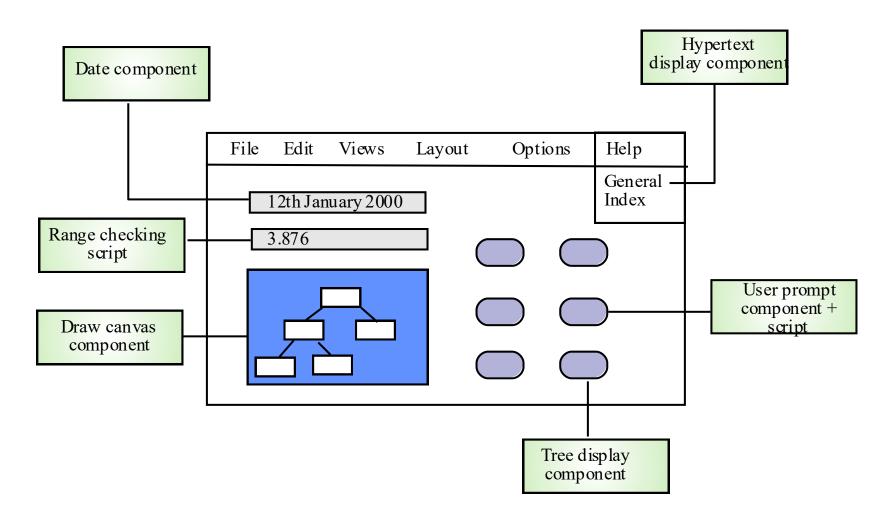

#### Application linking in compound documents

# Visual programming

- Scripting languages such as Visual Basic support visual programming where the prototype is developed by creating a user interface from standard items and associating components with these items
- A large library of components exists to support this type of development
- These may be tailored to suit the specific application requirements

# Visual programming with reuse

#### Problems with visual development

- Difficult to coordinate team-based development
- No explicit system architecture
- Complex dependencies between parts of the program can cause maintainability problems

### User interface prototyping

- It is impossible to pre-specify the look and feel of a user interface in an effective way, prototyping is essential
- UI development consumes an increasing part of overall system development costs
- User interface generators may be used to 'draw' the interface and simulate its functionality with components associated with interface entities
- Web interfaces may be prototyped using a web site editor

### Types of prototype

- Business prototypes
- Usability prototypes
- Performance and capacity
- Capability/technique prototypes

### Key points

- A prototype can be used to give end-users a concrete impression of the system's capabilities
- Prototyping is becoming increasingly used for system development where rapid development is essential
- Throw-away prototyping is used to understand the system requirements
- In evolutionary prototyping, the system is developed by evolving an initial version to the final version

### Key points

- Rapid development of prototypes is essential. This may require leaving out functionality or relaxing non-functional constraints
- Prototyping techniques include the use of very high-level languages, database programming and prototype construction from reusable components
- Prototyping is essential for parts of the system such as the user interface which cannot be effectively pre-specified. Users must be involved in prototype evaluation
